Reflection for Final Project

This was a challenging but rewarding project. I originally planned to include a branching scenario to enhance interaction with my pedagogical agent, but partway through the build, I realized Lumi's interactive book format does not support branching scenarios. Since I had already structured most of the module in this format, I decided to continue with the tools that were available like hotspots, drag-and-drop activities, and true/false quizzes to create an interactive experience.

I designed most of the visuals using Canva and generated the bar graphs with support from ChatGPT, although they required manual editing due to typos and alignment issues. For the pedagogical agent, I kept the design simple and used a Canva avatar that had different facial expressions. While I explored other character design platforms, many required subscriptions or one-time payments that didn't fit within my current budget for this project. Despite the simplicity, Canva still allowed me to create a consistent and friendly character presence throughout the module. I also used ElevenLabs for the agent's audio narration, since my microphone does not have the highest quality to record my own voice.

To test the flow of the module, I timed myself completing the training. It took me about 16 minutes, which is slightly under my original 20-minute target. However, this module is designed for high school English learners, and I expect that students may take longer to read, reread, and process the information. With that in mind, I believe the pacing is still appropriate for my intended audience. Overall, this project allowed me to explore many H5P features that I may use in my capstone project.
